

A robust application for Gamings and Arcade industry

Client profile

Kwikpay is the UK's first digital platform for multiple services. Kwikpay offers an easy to use, intuitive smartphone app (iOS & Android), allowing customers to buy multiple services.

Their main business section is based on a platform which can be used in multiple vertical sectors, offering contactless payment solutions, digital payments through an app, data analytics, user insights as well as enabling push notices to influence customer choice and increase sales.

Clients' requirement story

Kwikpay was looking for the solution that meets the requirements of the current Gaming Arcade Industry. They were trying to solve the challenge about cost effective stable product launch with single point company which can provide an entire product solution

Kwikpay has developed initial primary level hardware with basic communication verification which was not stable. They can not launch a product based on this preliminary study. SLS was introduced to leverage this concept with its high level-stable Nebulae infrastructure and do efficient-cost effective productization.

Client was trying to solve his challenge about cost effective stable product launch with single point company which can provide entire product solution. Kwikpay was looking for a solution which is not only robust and efficient but also meets requirements of the current Gaming Arcade Industry.

Business requirement

Kwikpay was looking for the solution that meets the requirements of the current Gaming Arcade Industry. They were trying to solve the challenge about cost effective stable product launch with single point company which can provide an entire product solution

SLS Contribution

SLS did entire productization including Hardware-Firmware-Software starting from the client's PoC based project.

SLS has re-architected and re-designed complete hardware and Software-Firmware. SLS's Nebulae solution which is covering end-to-end communication, FOTA (Firmware Over The

Air) Programming solutions are value added factors in this product. Kwikpay used this solution to integrate the kwikpay digital platform with Gaming Arcade and Amusement Systems. Client had concept/vision to make unique contactless digital payment products on paper. SLS has built an entire product with value added features beyond the client's vision.

SLS was chosen by client due to its Hardware Design-LAB Certification Capability like CE-RED/FCC as well as its unique Nebulae architecture.

Technical specifications

1. SLS has implemented Nebulae infrastructure which has high scalability and platform independent architecture
2. Added support of Wi-Fi and run time BLE-WiFi switching which was efficiently achievable with very little effort due to Nebulae core technology flexible structure and environment.
3. FOTA (Firmware Over The Air) is providing benefits of off-site programming without opening Gaming Controller Machine.

Benefits delivered/ Outcome

The Client has successfully deployed Gaming machine and with the complete product solution client is now doing a great business. In this project, SLS has provided complete (1)Product solution (2) Product Quality (3) Continuous Technical Support after product delivery (4) Payment terms are flexible. Client is very impressed with our Technical support during this Product deployment phase.
